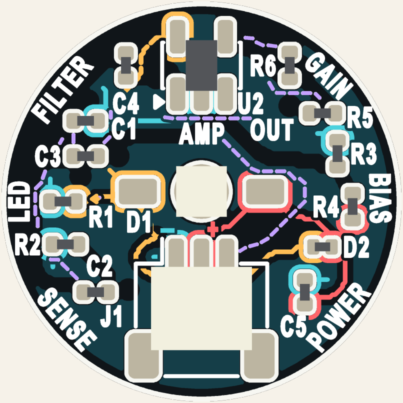
PULSESENSOR / OPEN HARDWARE

Meet your circuit.

Match the labels. Follow the connections.



D1 = LED   R1 = LED current limit
R3 + R4 = signal midpoint (bias)

1 POWER
D2 + C5

D2 protects the chips.
C5 bypasses supply noise.

2 INPUT
U1 + R2

U1 supplies the input.
R2 turns its current into a voltage.

3 FILTER
C1-C4

Capacitors shape the changing signal.

4 AMPLIFY
R5 + R6 + U2

Feedback sets gain.
OUT goes to J1.

● + supply ● Ground (-) ● Signal ● V+ / LED

TL;DR Power in. Filter + amplify. Signal out.

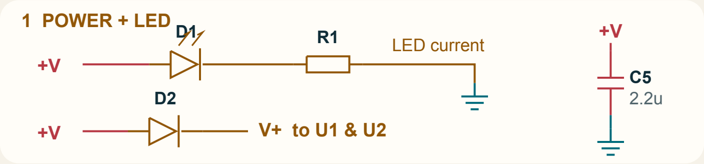
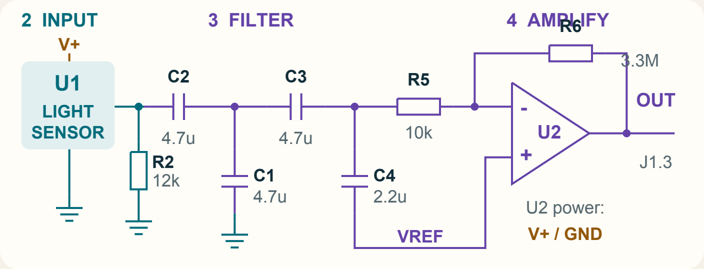
PULSESENSOR / FOLLOW THE CONNECTIONS

Same parts. Different view.





R = resistor **C = capacitor** **U = chip**

J1: 1 GND (-) 2 +V 3 OUT

Matching labels connect.
